

Problem Set 1

Due date: 18 September

```
library(tidyverse)
```

```
-- Attaching core tidyverse packages ----- tidyverse 2.0.0 --
v dplyr      1.1.3      v readr      2.1.4
v forcats    1.0.0      v stringr    1.5.0
v ggplot2    3.4.3      v tibble     3.2.1
v lubridate  1.9.2      v tidyr      1.3.0
v purrr      1.0.2
-- Conflicts ----- tidyverse_conflicts() --
x dplyr::filter() masks stats::filter()
x dplyr::lag()     masks stats::lag()
i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become
```

```
library(poliscidata)
```

```
Registered S3 method overwritten by 'gdata':
  method      from
reorder.factor gplots
```

Please upload your completed assignment to the ELMs course site (under the assignments menu). Remember to include an annotated script file for all work with R and show your math for all other problems (if applicable, or necessary). Please also upload your completed assignment to the Github repository that you have shared with us. *We should be able to run your script with no errors.*

Total points: 25

Question 1

Points: 5

Using the `gss` dataset (which has survey data with the individual respondent as the unit of analysis), create a frequency distribution and bar chart for each of the following variables: `degree` and `partyid_3`. Describe the distribution of each variable in detail.

i Note

The `gss` dataset can be found in `poliscidata::gss`. Take a look at `?gss` to see what these variables measure.

```
degree_data <- select(poliscidata::gss, degree)

degree <- table(degree_data)

barplot(degree, main = "Frequency of Degree", xlab = "Degree", ylab = "Frequency")
```

```
summary(degree)
```

Number of cases in table: 1974

Number of factors: 1

ANSWER: The highest number in the distribution is from people with HS diplomas

```
partyid_data <- select(poliscidata::gss, partyid_3)
partyid <- table(partyid_data)
barplot(partyid, main = "Frequency of partyid", xlab = "partyid", ylab = "Frequency")
```

```
summary(partyid)
```

Number of cases in table: 1906

Number of factors: 1

ANSWER: The distribution describes the party ID of voters, in this frequency table, the independents have the highest number.

Question 2

Examine the following vector of (fake) student IQ test scores:

```
iq <- c(
  145, 139, 126, 122, 125, 130, 96, 110, 118, 118, 101, 142, 134, 124, 112, 109,
  134, 113, 81, 113, 123, 94, 100, 136, 109, 131, 117, 110, 127, 124, 106, 124,
  115, 133, 116, 102, 127, 117, 109, 137, 117, 90, 103, 114, 139, 101, 122, 105,
  97, 89, 102, 108, 110, 128, 114, 112, 114, 102, 82, 101
)
```

Part A

Points: 5

Find the five-number summary, mean, and standard deviation for these data. Also, are there any suspected outliers in the distribution? If so, what are they and how do you know?

```
summary(iq)
```

Min.	1st Qu.	Median	Mean	3rd Qu.	Max.
81.0	104.5	114.0	115.0	125.2	145.0

```
iq_sd <- sd(iq)
iq_sd
```

```
[1] 14.80093
```

```
mean(iq)
```

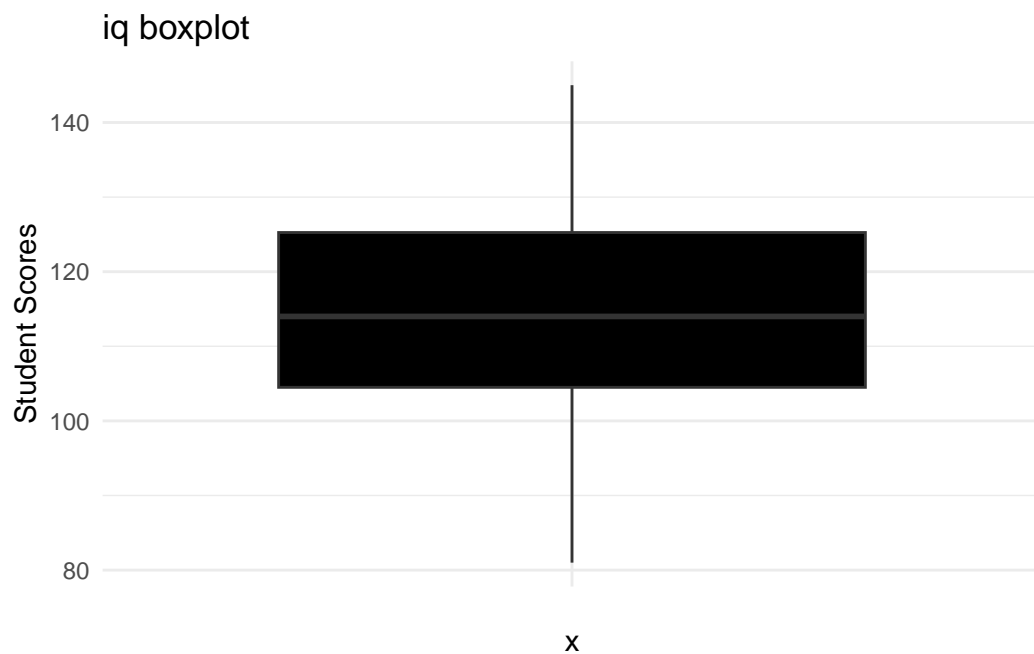

```
[1] 114.9833
```

```
sd(iq)
```

```
[1] 14.80093
```

```
iq.df <- data.frame(iq)

ggplot(iq.df, aes(x = "", y = iq)) +
  geom_boxplot(fill = "black") +
  labs(title = "iq boxplot", y = "Student Scores") +
  theme_minimal()
```

```
boxplot.stats(iq)$out
```

```
numeric(0)
```

```
outlier <- boxplot.stats(iq)$out
```

ANSWER: SD: 14.80 MEAN: 114.98

ANSWER: According to the presented the box plot there seems to be no *suspected* outliers.

Part B

Points: 5

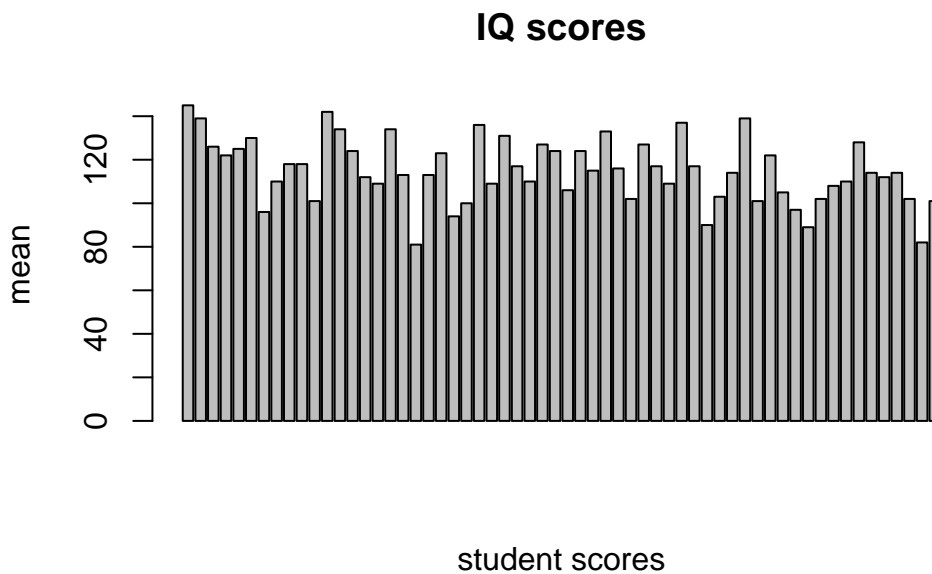

In large populations, IQ scores are standardized to have a mean of 100 and a standard deviation of 15. In what way does the distribution among these students differ from the overall population?

```
mean <- mean(iq)

sd <- sd(iq)

standard <- (iq - mean)/sd * 15 + 100

barplot(iq, main = "IQ scores", xlab = "student scores", ylab = "mean")
```

ANSWER: The distribution in this barplot is a bit hard to see but I believe that the distribution with these students differ from the overall population because their IQ is a bit higher. Testing/scores can be dependent on environmental conditions that are not taken into account (noise, test anxiety, sleep etc).

Question 3

Points: 5

A polling firm is interested in determining how different characteristics of an individual affect vote choice. They record the following characteristics for each survey respondent - race, age, household income, and party affiliation. What “type” of variable does each characteristic most likely represent?

ANSWER: Race is the categorical variable

Age is the continuous variable

Household income is the continuous

Party affiliation is the Categorical

Question 4

Points: 5

Using the `states` dataset (the unit of analysis is each U.S. state), generate a box plot and density curve for each of the `vep12_turnout` and `cig_tax12` variables. Describe the distribution of each variable in detail.

Note

The `states` data set can be found in `poliscidata::states`. Take a look at `?states` to see what these variables measure.

```
poliscidata::states
```

`?states`

Percent turnout of voting eligible population (2012)

- The density curve shows a normal distribution

Cigarette tax per pack (2012)

- The density curve shows a skewed right distribution
